ACME Salary Management System — Requirements Document

Version: 1.0 | Status: Draft

1. Goal

Build a secure, web-based salary management system that enables ACME’ s HR manager to maintain and analyze salary data for employees across multiple countries. The system will replace Excel-based workflows with a centralized source of truth, reduce manual errors, and help HR answer questions about how the organization pays its people.

2. Scope & Features

In scope (MVP)

- Portal access secured with login screen, limited to certain users now.
- Employee salary management: view employee salary records. Each record includes employee ID, name, department,country, base salary.
- Salary analytics and reporting: Provide dashboards and reports salary ranges, headcount by country, department.
  Future Release Enhancements :
- Natural-language questions: Allow authorized users to ask questions such as “What is the max salary by country?” or “Which departments have the highest average salaries?” and receive answers via AI LLM chats

3. Non-Functional Requirements

- Performance and scale: Support 10,000 employee records, with common searches and dashboard queries returning within 3 seconds under normal operating conditions.
- Accuracy: All reports must use validated source data with exposed endpoint to measure the source employee count
- Reliability and usability: Provide clear error messages and a simple interface usable by non-technical HR staff.

4. Deliberately Out of Scope

- Advanced AI-driven pay recommendations: The system will answer descriptive questions using verified calculations, but will not recommend individual salaries or make compensation decisions. This reduces the risk of unsupported conclusions and biased outcomes.
- Payroll processing and salary payments: The system manages salary information, not payroll calculations, tax deductions, or bank transfers. These introduce substantial financial and regulatory complexity.
- Employee self-service: Employees will not view or edit their own salary records in the MVP. The initial focus is the HR manager’ s workflow and reporting needs.
- Automatic currency conversion and live exchange rates: The MVP will use an explicitly configured exchange-rate source or supplied rates rather than introducing real-time financial data dependencies.

5. Success Criteria

The MVP will be considered successful when:

- Authorized HR users can view employee salary records without relying on spreadsheets as the primary system.
- unauthorized access is prevented.

Guiding principle: Deliver a secure, accurate salary data source and useful reporting first; expand into payroll, integrations, and compensation workflows only after the core system proves reliable.
